

Start of the trail session: The crew strings out along the line and gets to work.

A careful trail finisher grooms the tread after the line is hogged out.

Stump-pulling is a feature of every trail session, and these guys have pulled a bunch.

Good trail design includes grade reversals and undulation. This section came out very nice.

In places, a lot of deadfall, oak brush, and saplings had to be removed just to define the trail corridor.

Moving the last piece of deadfall opened the trail corridor into a rocky turn.

These guys jumped on the chance to work through the rocky turn... I think...

Boom, done: This rocky turn took a lot of time but they did a very good job.

Further down the crew still fought rocks, rocks, and more rocks.

Meanwhile the crosscut sawyers started at the top of Section TC03 to open the trail corridor.

The log jam is gone, the tread is cut in, and the crew heads down to the next challenge.

At the lower end of TC03, the boss discusses cut angles with the crosscut crew.

Thanks to the FOSM crosscut crew, all of Section TC03 was cleared and ready for trail building.

The Madera Locura junction with Elk Track is roughed in. Great design after a lot of head scratching.

A visitor dropped a feather while passing through.

This week it was the sunflowers' turn to bloom.
